

Mechatron and LFC Capital Announce \$5 Million Solar Program

REDWOOD CITY, Calif., September 5, 2014 /PRNewswire

Mechatron Solar, a world-class manufacturer in design, development and implementation of superior photovoltaic trackers has obtained an allocation of \$5 million for qualifying businesses desiring solar investment through LFC Capital's Solar Ownership Program. This Mechatron Solar/LFC Capital collaboration represents the latest round of a multi-stage rollout of LFC program funds.

LFC Capital, Inc. (www.lfccapital.com), a full service equipment finance company with more than \$1.5 billion of experience, created the LFC Solar Ownership Program to be the low-cost way for companies to purchase solar systems. According to Stanley S. Fishbein JD, LLM (Tax), Managing Director at LFC Capital, the program uses a traditional operating lease as the vehicle to share the monetized value of tax benefits with companies, thereby creating an affordable path to ownership. Companies obtain more value from the LFC program than from solar lease offerings typically found in the marketplace because all utility rebates and government incentive payments as well as renewable energy certificates, are for the customer.

"We are thrilled to partner with LFC Capital to satisfy the financial requirements of our customers," said Michael Fakukakis, CEO of Mechatron. The financial program that Mr. Fishbein and his team have developed for us is a superior financial tool and enables our customers to profit from the outset, greatly increasing the return on investment resulting from installation of a Mechatron solar tracker system."

Mechatron Solar is backed by many years of experience, know-how, state-of-the-art technology and innovation and a long list of successful and challenging industrial projects. Mechatron's solar trackers are designed to maximize performance at any given climate and terrain conditions. The dual axis Mechatron Solar Tracker D170 evolution is Mechatron's new model, which combines superior hydraulic motion mechanism and unsurpassed accuracy elevating the energy yield up to 40 percent, thanks to its capability of following the sun both azimuthally (around its vertical axis) and vertically (around its horizontal axis).
